

Master UX & Flow Restructure Brief

This document outlines the complete UX overhaul required for PromptMeGood. The current site suffers from "feature dumping" — showing every possible option at once without a clear, logical user journey. Execute the following structural changes across the app to transform it from a cluttered interface into a focused, step-by-step tool.

1. The Text Panel (Pre-Generation)

Problem: The left column is overwhelmed by competing elements. The Generate button is pushed below the fold by the open Tuning accordion.

Fixes:

- **Collapse the Tuning Accordion:** The "Tune Your Prompt" section must be collapsed by default on all viewports. Users should only open it if they actively want to tune.
- **Elevate the Generate Button:** The primary "Fix My Prompt" (or Generate) button must sit directly below the main textarea, always visible without scrolling.
- **De-emphasize the Whisperer:** The Prompt Whisperer should not compete with the main input. Move it behind a toggle or visually demote it.

2. The Text Panel (Post-Generation)

Problem: After generating, the user is hit with 8 different buttons (Edit, Rewrite, Save, Run With AI, ChatGPT, Claude, Perplexity, Gemini) fighting for attention.

Fixes:

- **Hero the Primary Action:** "Run With AI Here" must be the undeniable primary CTA below the generated prompt.
- **Demote External Links:** The buttons for ChatGPT, Claude, etc., must be visually de-emphasized (e.g., smaller, ghost buttons) so they don't compete with the primary action.
- **Add Breathing Room:** Add margin above the utility row (Edit, Rewrite, Save Draft) so the generated text doesn't feel cramped.

3. The Photography & Video Panels (The "Black Box" Fix)

Problem: These panels suffer from severe pill overload. Users click dozens of options (Camera, Lighting, Mood) but cannot see the prompt being built. It operates as a black box until they click "Build".

Fixes:

- **Live Assembly Preview:** Add a read-only `textarea` or styled `div` directly below the main inputs (Subject/Environment) but *above* the pill groups. As the user types or clicks pills, this box must update in real-time to show the exact prompt string being constructed.
- **Collapse the Clutter:** Keep Subject, Environment, and the base Style selector visible. Wrap all other pill groups (Camera, Lighting, Color, Pro Boosts) inside an accordion labeled "Advanced Tuning" that is collapsed by default.
- **Logical Flow:** The flow must be: Input -> Tune (optional) -> See Live Preview -> Click "Generate Image" / "Generate Video". Rename the confusing "Build My Prompt" buttons to "Generate".

4. The Guide & Pricing Pages

Problem: The Guide references buttons that don't exist ("Analyze My Idea", "Image Workshop"). The Pricing page in the repo is missing the \$79 Founding Member tier that exists on the live site.

Fixes:

- **Sync the Guide:** Rewrite the Guide copy to match the *actual* button names and features currently in the app UI.
- **Sync Pricing:** Update the `pricing.html` in the repo to include the \$79 Founding Member tier so it matches the live site and doesn't overwrite it on the next deploy.

Execute these changes directly. Focus on creating a clean, logical flow where the next step is always obvious.
