

Replit Command: Post-Generation Cleanup & Flow

Copy and paste the following command directly into Replit. This focuses on the user experience *after* they click Generate, ensuring the next steps are obvious and the layout remains clean.

Command for Replit:

Execute a targeted cleanup on the post-generation state of the app (`index.html` and associated CSS/JS). When a user clicks "Generate My Prompt", the resulting UI feels cramped and the next steps are not prioritized correctly. Fix the following exactly as described:

1. Elevate the "Run With AI Here" Button

- The `Run With AI Here` button (which executes the prompt) must be the most prominent, visually distinct action below the generated prompt.
- Ensure it has enough breathing room (margin/padding) from the prompt editing tools (Edit, Rewrite, Save Draft) so it stands out as the primary next step.

2. De-emphasize External AI Links

- The buttons to send the prompt to external AI tools (ChatGPT, Claude, Perplexity, Gemini) are currently taking up too much visual weight.
- Visually de-emphasize these buttons (e.g., make them secondary buttons, ghost buttons, or smaller) so they do not compete with the primary `Run With AI Here` action. They are secondary options, not the main event.

3. Clean Up the Prompt Editing Row

- The `Edit`, `Rewrite`, and `Save Draft` buttons sit very close to the generated prompt text area.
- Add subtle spacing above this row to let the generated prompt breathe, and ensure these buttons look like utility actions rather than primary CTAs.

4. Ensure "Start Over" is Always Accessible

- The `Start Over` link at the very bottom of the right column can get lost if the generated prompt is long.
- Ensure it remains clearly visible and accessible, perhaps by giving it a bit more vertical space or ensuring it doesn't get pushed off-screen unnecessarily.

Make these changes directly in the code. Do not ask for permission to adjust padding or margins to make it look clean — just execute the cleanup.
