

Replit Fix Brief: Strength Bar & Auto-Boost Restoration

Replit, we have three critical UI bugs in the right column output area that need to be fixed immediately. These likely broke during the recent addition of the "How should the AI think?" section.

Bug 1: The Strength Bar Fill is Broken (Showing 0%)

The Prompt Strength bar is rendering its track and label (e.g., "Needs more detail"), but the actual colored fill element inside the bar is not receiving its width percentage from the API score. It is rendering as an empty bar.

The Fix:

In the JavaScript function that handles the API response after prompt generation (likely in `pmg-chassis-v3.js` or `pmg-suite-handoff.js`), ensure the score is correctly parsed and applied to the fill element's `width` style.

JavaScript

```
// Example of what needs to be fixed/verified:
const strengthFill = document.querySelector('.pmgv3-strength-fill');
// Ensure 'score' is a valid number between 0 and 100
strengthFill.style.width = `${score}%`;

// Also ensure the color updates based on the score
if (score < 40) strengthFill.style.backgroundColor = '#ff4444'; // Red
else if (score < 70) strengthFill.style.backgroundColor = '#ffb800'; // Yellow
else strengthFill.style.backgroundColor = '#00c896'; // Green
```

Bug 2: Duplicate Strength Bar Track

There are currently two empty bar tracks rendering stacked on top of each other.

The Fix:

Check the HTML structure for the `#pmgv3-strength-slot` container. There should only be **one** track element (`.pmgv3-strength-track`) containing **one** fill element (`.pmgv3-strength-fill`). Remove the duplicate track from the HTML or the JavaScript injection logic.

HTML

```

<!-- CORRECT STRUCTURE -->
<div class="pmgv3-strength-container">
  <div class="pmgv3-strength-label">PROMPT STRENGTH</div>
  <div class="pmgv3-strength-text">Needs more detail</div>
  <div class="pmgv3-strength-track">
    <div class="pmgv3-strength-fill" style="width: 0%;"></div>
  </div>
</div>

```

Bug 3: Auto-Boost Button is Missing

The "🌟🌟🌟 Auto-Boost Prompt" button was accidentally removed from the right column.

The Fix:

Restore the Auto-Boost button to its correct position. It must be placed **below** the Prompt Strength section and **above** the "YOUR ENGINEERED PROMPT" output box.

HTML

```

<!-- Restore this button -->
<button class="pmgv3-btn-primary" id="btn-auto-boost" style="margin-bottom: 16px;">
  🌟🌟🌟 Auto-Boost Prompt
</button>

```

Ensure the click handler for `#btn-auto-boost` is still intact and properly wired to the boost API endpoint.

Bug 4: Hide Strength Bar on Initial Load

As a reminder, the entire `#pmgv3-strength-slot` container must have `display: none` on initial page load. It should only become visible (`display: block` or `flex`) *after* a prompt has been successfully generated. Do not show an empty strength bar to the user before they have done anything.
