

PromptMeGood Live UX Findings

This document outlines the remaining friction points and aesthetic issues found during a live walkthrough of the current promptmegood.com site. These are issues a real first-time user would encounter today.

1. The Homepage Hero Gap

The Issue:

There is a massive empty gap (approximately 471px) between the hero text ("Finally, AI That Understands You") and the feature cards below it on the homepage.

The Cause:

The `<body>` element is set to `display: flex; flex-direction: column; min-height: 100vh;`. The `<main class="hero">` element has `flex-grow: 1`. This forces the hero section to stretch and fill all available vertical space in the viewport, pushing the feature cards down to the very bottom of the screen. The actual content inside the hero is only ~246px tall, leaving a huge empty void.

The Fix:

Remove `flex-grow: 1` from `main.hero` or change the body layout so the hero doesn't stretch to fill the viewport.

CSS

```
main.hero {  
  flex-grow: 0; /* Stop the hero from stretching */  
  padding-bottom: 80px; /* Add a fixed, tasteful amount of space instead */  
}
```

2. The "Help Me Start" Button Duplication

The Issue:

In the main app (/app), the "💡 Help Me Start (Answer 4 Quick Questions)" button appears twice in close proximity. It is located at the very top right of the screen (next to the Help and User icons) and again prominently above the "Your Goal" input field.

The Impact:

This creates visual clutter and confusion. The user doesn't know which one to click, and it makes the interface feel less polished.

The Fix:

Remove the top-right "Help Me Start" button. The one directly above the input field is perfectly placed and has the "MOST LOVED" badge, making it the clear primary call to action for new users.

3. The "Customize Output" Section is Overwhelming

The Issue:

The " Customize Output (Optional)" section is a massive block of text and options that pushes the actual "Fix My Prompt" button further down the page. It contains explanations for Money Mode, Human Voice Mode, and Clarity Boost Mode, along with several sub-options.

The Impact:

For a first-time user, this is a wall of text that creates cognitive overload before they've even generated their first prompt. It violates the principle of progressive disclosure.

The Fix:

Keep the section collapsed by default (it currently is a `<summary>` element, which is good). However, the content inside should be simplified. Instead of long paragraphs explaining what each mode does, use concise tooltips or brief one-sentence descriptions.

4. The Visual Studio Modal Launchers

The Issue:

The buttons to launch the Visual Studio features (" Image Studio", " Sora Video", " Storyboard") are located at the very bottom of the page, below the "Fix My Prompt" button and the live preview area.

The Impact:

Users have to scroll past the entire prompt tuning section to discover these signature features. They are hidden away rather than being presented as primary capabilities of the platform.

The Fix:

Move these launchers higher up in the visual hierarchy. A good place would be near the top, perhaps as a toggle switch or a prominent row of buttons just below the main "Your Goal" input, so users immediately know they can generate images and videos, not just text.

Summary

The site is functionally solid, but these aesthetic and layout issues create friction for new users. Fixing the homepage gap and cleaning up the app interface will significantly elevate

the perceived quality of the product.
