

Task: Move fullscreen toggle buttons inside their boxes — top-right corner, icon only

Context

Both `#resultBoxToggle` and `#aiResponseToggle` currently sit as sibling elements outside their respective boxes in the DOM. The user wants them moved inside the box so they do not affect layout or push anything around.

Current DOM order (both boxes follow this same pattern):

- Toggle button (sibling, outside the box)
- The box itself

Target: button lives inside the box, pinned to the top-right corner with absolute positioning.

The Change

1. Prompt box — use a wrapper div (required because result-box is contenteditable)

`#resultBox` is `contenteditable="true"` — browsers do not allow interactive elements like `<button>` inside a contenteditable element. The fix is a wrapper div:

Before:

HTML

```
<button type="button" class="result-box-toggle" id="resultBoxToggle" aria-expanded="false">⌕</button>
<div class="result-box" id="resultBox" contenteditable="true" ...>...</div>
```

After:

HTML

```
<div class="result-box-wrap">
  <button type="button" class="result-box-toggle" id="resultBoxToggle" aria-label="Fullscreen" data-test="result-box-toggle">⌕</button>
  <div class="result-box" id="resultBox" contenteditable="true" ...>...</div>
</div>
```

2. AI Response box — button goes directly inside the output div

`#aiResponseOutput` is a normal div (not contenteditable), so the button can live inside it directly.

Before:

HTML

```
<div class="ai-response-output" id="aiResponseOutput" ...></div>
<button type="button" class="ai-response-toggle" id="aiResponseToggle" aria-exp
```

After:

HTML

```
<div class="ai-response-output" id="aiResponseOutput" ...>
  <button type="button" class="ai-response-toggle" id="aiResponseToggle" aria-l
</div>
```

3. CSS changes

Add/update these rules:

CSS

```
/* Wrapper for the prompt box – needed to host the absolute button */
.result-box-wrap {
  position: relative;
}

/* AI response output already exists – just add position: relative */
.ai-response-output {
  position: relative;
  /* all existing rules stay the same */
}

/* Both toggle buttons – shared rules */
.result-box-toggle,
.ai-response-toggle {
  position: absolute;
  top: 8px;
  right: 8px;
  z-index: 2;
  margin: 0; /* remove old flow margin */
  padding: 5px;
```

```

width: 28px;
height: 28px;
display: none; /* hidden until .is-visible added by JS */
align-items: center;
justify-content: center;
font-size: 15px;
line-height: 1;
background: var(--color-surface);
border: 1px solid var(--color-border);
border-radius: 6px;
color: var(--color-primary);
cursor: pointer;
opacity: 0.45;
transition: opacity 120ms ease;
}

.result-box-toggle.is-visible,
.ai-response-toggle.is-visible {
  display: inline-flex;
}

.result-box-toggle:hover,
.ai-response-toggle:hover,
.result-box-toggle:focus-visible,
.ai-response-toggle:focus-visible {
  opacity: 1;
}

.result-box-toggle:focus-visible,
.ai-response-toggle:focus-visible {
  outline: 2px solid var(--color-primary);
  outline-offset: 2px;
}

```

4. JS — no changes needed

The JS logic in `app.html` (around line 8834) and `pmg-fullscreen.js` does not need to change. It still:

- Finds `#resultBoxToggle` and `#aiResponseToggle` by ID
- Adds/removes `.is-visible` when content exists
- Calls `window.pmgFullscreen.open()` on click
- Updates `textContent` to "🔍 Open Fullscreen" when content is present

The only text change: since the button is now icon-only (`❏`), remove the JS lines that set `textContent` to "`🔍 Open Fullscreen`" or "`Show Full Prompt ▼`" / "`Show Full Response ▼`". The button label is now fixed as the icon; the `aria-label` handles accessibility.

Specifically, in `app.html` find and remove/neutralize these JS lines:

- `resultBoxToggle.textContent = '\uD83D\uDD0D Open Fullscreen';`
- `resultBoxToggle.textContent = 'Show Full Prompt \u25BE';`
- `resultBoxToggle.textContent = 'Collapse Prompt \u25B4';`
- `aiResponseToggle.textContent = '\uD83D\uDD0D Open Fullscreen';`
- `aiResponseToggle.textContent = 'Show Full Response \u25BE';`

Replace each with a no-op comment or just delete the line — the icon in the HTML is the label now.

Expected Result

- Both boxes show a small `❏` icon button pinned to the top-right corner when content is present.
- The icon is quiet (45% opacity) at rest, full opacity on hover/focus.
- No layout shift — the button is absolutely positioned inside the box, not in flow.
- No elements outside the boxes pushing layout around.
- Works on mobile and desktop.
- Accessibility: `aria-label="Open fullscreen"` on both buttons.
