

PromptMeGood: Dead-End Map & Fix Instructions

This report documents the exact dead ends, loops, and stuck states encountered by a first-time user navigating the live app, along with precise code-level fixes for Replit.

1. The Visual Studio Modal Dead End (Critical)

The User Experience:

When a user clicks the "🎨 Open Visual Studio" button (or the "Try Image Mode" buttons), the right panel content changes slightly, but no full-screen modal opens. The user is left staring at the same screen, unable to actually use the Image Studio.

The Root Cause:

The `openVisualStudio()` function successfully removes the `hidden` attribute from the modal (`#pmg-visual-studio-modal`). However, the modal remains invisible because of a CSS specificity conflict.

The CSS contains this rule:

CSS

```
#pmg-visual-studio-modal.pmg-modal-overlay {  
  display: flex;  
  /* ... */  
}
```

But it also contains this rule which overrides it when the `hidden` attribute is present:

CSS

```
#pmg-visual-studio-modal[hidden] {  
  display: none !important;  
}
```

The issue is that the modal is wrapped inside a parent container (`.pmg-workstation-promote`) that might be interfering, or the `pmg-vs-inline` class logic is failing to trigger correctly on desktop. The live DOM shows the modal has `display: none` computed, even when `hidden` is false.

The Fix for Replit:

1. **Force the display state in JS:** In `pmg-visual-studio.js`, inside `openVisualStudio()`, explicitly

set the display style:

JavaScript

```
m.removeAttribute('hidden');  
m.style.display = 'flex'; // Force it visible
```

2. **Fix the CSS specificity:** Ensure the overlay class always wins when not hidden:

CSS

```
#pmg-visual-studio-modal.pmg-modal-overlay:not([hidden]) {  
  display: flex !important;  
}
```

2. The Storyboard Dead End (High)

The User Experience:

The user clicks the "Storyboard" button at the bottom of the app. Nothing happens. No loading spinner, no error message, no new panel. The user is stuck.

The Root Cause:

The frontend is calling an API endpoint (`/api/storyboard`) that does not exist on the backend server, resulting in a silent 404 error.

The Fix for Replit:

1. **Add the backend route:** In `api-server/src/routes/ai.ts` , add the missing POST route for `/api/storyboard` that interfaces with GPT-4o to generate the 5 sequential prompts.
2. **Add frontend error handling:** In the storyboard JS, add a `.catch()` block to the fetch call that displays a visible error toast to the user if the API fails, rather than failing silently.

3. The "Help Me Start" Loop (Medium)

The User Experience:

The user sees "Help Me Start" in the top navigation bar and clicks it. They also see "Help Me Start (Answer 4 Quick Questions)" above the goal input. Having two identical calls to action creates confusion about where to begin.

The Fix for Replit:

1. **Remove the duplicate:** Delete the "Help Me Start" button from the top navigation bar. Keep only the prominent one above the goal input with the "MOST LOVED" badge.

- 2. **Rename for clarity:** Rename the remaining button to "Guided Setup" to make its purpose immediately clear and reduce visual clutter.

4. The "Customize Output" Overload (Medium)

The User Experience:

Before generating their first prompt, the user is confronted with a massive, expanded "Customize Output" section containing Money Mode, Human Voice, and Clarity Boost options. This creates cognitive overload and friction.

The Fix for Replit:

- 1. **Collapse by default:** Ensure the "Customize Output" (rename to "Advanced Settings") section is collapsed by default on page load.
- 2. **Simplify descriptions:** Shorten the descriptions for each mode to a single, punchy line.

Summary of Renames for Replit

Current Label	New Label
"Visual Asset Engine / Photography Suite"	"Image Prompt Builder"
"Open Visual Studio"	"Launch Image Studio"
"Master Link — OFF"	"Sync With Text Prompt"
"Help Me Start (Answer 4 Quick Questions)"	"Guided Setup"
"Customize Output (Optional)"	"Advanced Settings"
