

PromptMeGood End-to-End Audit Findings

I have conducted a comprehensive audit of the new `pmg-chassis-v3` layout on both desktop and mobile viewports. The audit covered the core layout structure, the prompt generation flow, and the Photography module integration.

Here are the critical issues identified that are currently breaking the user experience.

1. The Photography Module is Completely Broken (Desktop & Mobile)

When a user clicks the "Photography" tab, the system attempts to open the Visual Studio modal (`pmg-visual-studio-modal`). However, the modal never appears on screen.

The Root Cause:

The new `pmg-chassis-v3.css` file includes a highly aggressive CSS rule designed to hide legacy elements:

CSS

```
html.pmg-chassis-v3 body > :not(#pmg-chassis-v3-root):not(script):not(style):not(
  display: none !important;
  visibility: hidden !important;
}
```

Because the Visual Studio modal (`#pmg-visual-studio-modal`) is injected directly into the `<body>` element (outside of `#pmg-chassis-v3-root`), this CSS rule forcefully hides it. The modal is technically in the DOM and functioning, but it is completely invisible to the user.

2. Mobile Layout Issues (390px Viewport)

The mobile experience suffers from several layout and spacing issues that make the app feel cramped and difficult to use.

A. The "Live Feedback" Panel Eats the Viewport

On mobile, the "Live Feedback" panel (`#pmg-tf-feedback`) appears immediately below the goal input, taking up approximately 189px of vertical space before the user has even typed anything. This pushes the critical "Analyze My Idea" button below the fold on smaller screens.

B. The Bottom Bar is Missing

The `pmgv3-bottom` bar, which contains the quick entry pill, is explicitly hidden on mobile via a media query in `pmg-chassis-v3.css` :

CSS

```
@media (max-width: 768px) {  
  .pmgv3-bottom {  
    display: none !important;  
  }  
}
```

While this was likely an intentional design choice to reduce clutter, it removes a key interaction point for users on mobile devices.

C. Tuning Pills are Too Large

The tuning pills in the prompt tuning section inherit desktop sizing, making them too large for comfortable mobile use. They wrap awkwardly and consume too much vertical space.

3. Desktop Layout Issues

While the desktop layout is generally more stable, there are a few structural concerns.

A. Redundant "Live Feedback" Elements

The DOM contains multiple elements related to "Live Feedback," including a relocated strength score (`#strength-score.pmgv3-relocated`) and the main feedback section (`#pmg-tf-feedback`). This redundancy suggests incomplete cleanup of legacy components during the v3 migration.

B. Inconsistent Modal Handling

The aggressive `body > *` hiding rule mentioned above likely affects other modals or overlays that are appended directly to the body, not just the Photography module. Any toast notifications, tooltips, or dialogs outside the v3 root will be invisible.

Recommended Fix Strategy

To resolve these issues, we need a surgical update to the `pmg-chassis-v3.css` file. The priority is to unblock the Photography module and fix the mobile viewport constraints.

1. **Fix the Photography Module:** Add an exception to the aggressive `body > *` hiding rule to allow the Visual Studio modal (and other critical overlays) to render.

2. **Optimize Mobile Viewport:** Adjust the mobile media queries to handle the "Live Feedback" panel more gracefully (e.g., hide it until the user starts typing) and resize the tuning pills for touch targets.
3. **Review Bottom Bar:** Decide whether to restore the bottom bar on mobile or ensure the primary input is always accessible.
