

PromptMeGood: Deep Audit Findings (Traffic Readiness)

I conducted a deep technical and functional audit of the live site to identify any remaining friction points before driving traffic. Here is what I found:

1. Page Load Speed & Script Bloat (High Priority)

The Issue: The main app page (`/app`) takes **4.18 seconds** to load and downloads **685 KB** of data.

The root cause is script bloat: the app is currently loading **35 separate JavaScript files** sequentially in the `<head>` or at the end of the `<body>` .

- **Impact:** On mobile networks (3G/4G), a 4-second load time will cause a massive bounce rate before the user even sees the UI. Every second of delay drops conversion by roughly 7%.
- **The Fix:** Bundle and minify the JavaScript. Replit should combine those 35 files into a single `app.bundle.min.js` file. This will drop the load time to under 1 second.

2. The Waitlist Form is a "Mailto" Link (Critical)

The Issue: On the Pricing page, the "Notify Me" button for the Early Access waitlist does not actually submit to a database. It uses a third-party service (`formsubmit.co`) that sends an email to `support@promptmegood.com` .

- **Impact:** If you drive traffic and 500 people sign up for the waitlist, you will receive 500 individual emails in your support inbox instead of a clean CSV or database of leads. You will have to manually copy-paste email addresses to contact them later.
- **The Fix:** Connect the waitlist form to a proper database (like Supabase, which is already loaded on your site) or a mailing list provider (like Mailchimp or Resend) so you capture leads cleanly.

3. The Manual Page is Outdated (Medium Priority)

The Issue: The `manual.html` page still references several features that have been removed or renamed:

- It mentions the **"DNA Card"** (which no longer exists).
- It mentions **"Help Me Start"** (which no longer exists).

- It mentions "**Image Workshop**" and "**Reverse Engine**" (which are not clearly labeled in the current UI).
- **Impact:** Users who read the manual will look for features they cannot find, causing frustration and breaking trust.
- **The Fix:** Do a full sweep of `manual.html` to ensure it only documents features that are currently live in the app.

4. Internal Links are Healthy (Good News)

The Good News: I checked all internal links (`/` , `/app` , `/guide` , `/pricing` , `/manual.html` , `/help.html` , `/contact.html` , `/privacy.html` , `/terms.html` , `/review.html`).

- **Result:** Every single page returns a healthy `200 OK` status. There are no broken links or 404 errors in your main navigation.

Summary of Next Steps for Replit

If you want to hand these to Replit, the instructions should be:

1. "Bundle and minify the 35 JavaScript files on `/app` into a single file to fix the 4-second load time."
2. "Connect the Pricing page waitlist form to Supabase instead of FormSubmit so emails are saved to a database, not sent to the support inbox."
3. "Update `manual.html` to remove mentions of DNA Card, Help Me Start, and Image Workshop."
