

PromptMeGood: Contextual Flow Audit

I walked the entire site as a complete stranger to answer your question: *Does the site work as a cohesive system? Are the next steps painfully obvious?*

The short answer is **no**. The site looks sophisticated, but the flow is broken. Users are forced to guess what to do next at almost every step.

Here is the breakdown of the journey and where the mechanisms fail to fit together.

1. The Landing Page to App Transition (The "Lost Context" Problem)

- **What happens:** A user lands on `promptmegood.com`. The redirect script immediately sends them to `/app`.
- **The friction:** They never see the landing page. They are dropped into a complex workstation with three tabs (Text, Photography, Video), a "Prompt Whisperer", a "Your Idea" box, and a bunch of "Start Fast" pills.
- **Is the next step obvious?** No. There is no onboarding, no "Start Here" indicator, and no explanation of what the tool actually does. The user has to guess whether they should type in the Whisperer, type in the Idea box, or click a pill.

2. The Text Panel Flow (The "Buried Action" Problem)

- **What happens:** The user decides to type their idea into the main "Your Idea" box.
- **The friction:** After typing, they look for a "Generate" or "Go" button. But right below the text box is a link that says "Need inspiration? Browse templates", followed by a massive "Analyze My Idea" button.
- **Is the next step obvious?** No. "Analyze My Idea" sounds like a diagnostic tool, not a generation tool. The user wants to *build* a prompt, not analyze an idea. The language is confusing.

3. The Post-Generation State (The "Choice Overload" Problem)

- **What happens:** The user clicks "Analyze My Idea" and a prompt is generated in the right column.
- **The friction:** Below the generated prompt, the user is hit with a wall of buttons: Edit, Rewrite, Save Draft, Run With AI Here, ChatGPT, Claude, Perplexity, Gemini.

- **Is the next step obvious?** No. The user is overwhelmed by 8 different choices of equal visual weight. The primary action ("Run With AI Here" or "Copy to Clipboard") is lost in the noise.

4. The Photography & Video Panels (The "Black Box" Problem)

- **What happens:** The user switches to the Photography or Video tab. They see a text box and dozens of pills for Camera, Lighting, Style, etc.
- **The friction:** They click a few pills, but nothing happens on screen. The prompt isn't building visibly. They have to click a "Build My Image Prompt" button at the very bottom to see what they just did.
- **Is the next step obvious?** No. The connection between clicking a pill and building a prompt is completely severed. It feels like clicking buttons into a void.

5. The Guide and Pricing Pages (The "Stale Reality" Problem)

- **What happens:** The user gets confused and clicks the " ? " icon to read the Guide.
- **The friction:** The Guide tells them to click " ✨ Generate My Prompt" and use the "Image Workshop" and "DNA Card". None of these things exist in the app UI they just came from.
- **Is the next step obvious?** No. The Guide actively misleads them by referencing a past version of the app.

The Verdict

The mechanisms do not fit together like a puzzle. The site feels like a collection of powerful features that were bolted together without a unifying user journey.

To fix this, the site needs a **linear, guided flow**:

1. **Landing Page:** Show the value prop first, *then* hand off to the app.
2. **Clear Primary Action:** The main text box should have one massive, undeniable button: "Build My Prompt".
3. **Live Feedback:** The Media panels must show the prompt building in real-time as pills are clicked.
4. **Focused Next Steps:** After generation, show ONE primary next step ("Run With AI") and hide the rest under an "Options" menu.
