

PromptMeGood — Mobile UX Fix: The Workstation Tab Regression

Prepared by: Manus AI

Date: May 2026

This document addresses the critical regression on the mobile Workstation tab. Previous attempts to fix the layout have resulted in the form being partially visible but completely broken in structure.

The Current Broken State (As of Latest Screenshot)

When a user opens the app on mobile and taps the **Workstation** tab, they see:

1. A floating URL bar at the top.
2. A massive, full-width green "Fix My Prompt" button floating at the top.
3. A "Help Me Start" button floating below it.
4. The "Prompt Tuning" section (Step 1) rendering below that.
5. The bottom dock (Vault / Workstation / Visual) overlapping the content.
6. **The goal textarea (where the user actually types their prompt) is completely missing.**
7. **The result panel (Step 2) is completely missing.**

The layout is completely shattered. The elements are rendering out of order, and the most critical input field is gone.

The Root Cause

The `pmg-chassis-v2` redesign attempted to create a "collapsible composer" for mobile, moving the form into a fixed bottom bar (`.pmgv2-composer-wrap`). Previous fixes attempted to undo this by changing CSS `position` properties, but the underlying HTML structure and JavaScript logic are fighting each other.

The form elements are being ripped out of their natural order, and the `pmgv2-thread` (the result panel) is being hidden entirely on the Workstation tab.

The Fix: Restore the Natural Stack

We must stop trying to hack the fixed positioning and restore the natural, vertical

document flow for the Workstation tab on mobile.

Step 1: Fix the CSS Layout for the Workstation Tab

The Workstation tab (`data-pmgv2-mobile-tab="thread"`) must show **both** the form (`.pmgv2-composer-wrap`) and the result panel (`.pmgv2-thread`) in a natural vertical stack.

In `pmg-chassis-v2.css` (or your main stylesheet), replace the existing mobile rules for the composer wrap with this:

CSS

```
@media (max-width: 900px) {  
  /* 1. Ensure the main container stacks its children vertically */  
  html.pmg-chassis-v2[data-pmgv2-mobile-tab="thread"] .pmgv2-main {  
    display: flex !important;  
    flex-direction: column !important;  
    padding-bottom: 80px !important; /* Clear the bottom dock */  
  }  
  
  /* 2. Disable the fixed bottom pill behavior entirely */  
  html.pmg-chassis-v2 .pmgv2-composer-wrap {  
    position: relative !important;  
    bottom: auto !important;  
    left: auto !important;  
    right: auto !important;  
    z-index: 1 !important;  
    padding: 16px !important;  
    background: transparent !important;  
    border: none !important;  
    display: block !important; /* Ensure it is visible */  
  }  
  
  /* 3. Ensure the form itself stacks naturally */  
  html.pmg-chassis-v2 .pmgv2-composer-wrap #prompt-form {  
    display: flex !important;  
    flex-direction: column !important;  
    gap: 16px !important;  
  }  
  
  /* 4. Ensure the result panel is visible below the form */  
  html.pmg-chassis-v2[data-pmgv2-mobile-tab="thread"] .pmgv2-thread {  
    display: flex !important;  
    flex-direction: column !important;  
    margin-top: 24px !important;  
  }  
}
```

Step 2: Fix the Element Order (HTML/JS)

The "Fix My Prompt" button and "Help Me Start" button are floating at the top because JavaScript (likely in `pmg-fixes-v6.js`) is aggressively reordering them on mobile.

In `pmg-fixes-v6.js` (or wherever the mobile reordering logic lives):

1. **Find and remove/disable** any function that moves `#generateBtnTop` or `#pmg-help-me-start-btn` outside of the `#prompt-form`.
2. **Find and remove/disable** any function that adds the `pmg-composer-collapsed` class to the `<html>` element.

The HTML structure inside `.pmgv2-composer-wrap` must remain:

1. Goal Textarea (`#goal`)
2. Prompt Tuning (`#settingsPanel`)
3. Action Row (containing the Generate button)

Step 3: Fix the Prompt Tuning Accordion

The Prompt Tuning section is taking up too much vertical space. It must be collapsed by default on mobile.

Add this CSS:

CSS

```
@media (max-width: 900px) {
  #settingsPanel {
    max-height: 60px; /* Just enough to show the header */
    overflow: hidden;
    transition: max-height 0.3s ease;
  }

  #settingsPanel.expanded {
    max-height: 2000px; /* Large enough to fit content */
  }
}
```

Add this JS to toggle it:

JavaScript

```
document.addEventListener('DOMContentLoaded', () => {
  const tuningHeader = document.querySelector('#settingsPanel .pmg-seam-header')
  const tuningPanel = document.getElementById('settingsPanel');
```

```
if (tuningHeader && tuningPanel && window.innerWidth <= 900) {  
  tuningHeader.addEventListener('click', () => {  
    tuningPanel.classList.toggle('expanded');  
  });  
}  
});
```

Expected Outcome

After applying these fixes, tapping the **Workstation** tab on mobile will display a clean, vertical stack:

1. The Template Picker
2. **The Goal Textarea** (Where the user types)
3. **Prompt Tuning** (Collapsed to just the header)
4. **The "Fix My Prompt" Button**
5. **The Result Panel** (Waiting for input)

This completely removes the broken "floating pill" concept and restores a functional, usable mobile layout.
