

# PromptMeGood: 3 Small Changes — Do Not Overhaul Anything

## To the Replit AI Agent:

Make exactly these 3 changes and nothing else. Do not restructure the UI. Do not refactor existing code. Do not add new modals or tabs. Small, surgical additions only.

---

## Change 1: Add 3 New Personality Options to the Dropdown

In the existing Personality dropdown (inside the Settings Panel / `settingsPanel`), add these three new options. Place them **at the bottom of the list**, after all the existing options, so the unique PromptMeGood personalities (Faith-Based, Street-Smart, Luxury Brand Voice, Viral Social Media Voice) remain prominent at the top.

The three options to add:

- **Technical** — Highly specific, implementation-focused, uses exact terminology
  - **Academic** — Rigorous, well-structured, and formally defined
  - **Developer** — XML-structured output for AI coding tools
- 

## Change 2: Persist the Personality Selection to localStorage

Right now, when a user selects a Personality and then refreshes the page or comes back later, their selection resets to the default. Fix this by saving the selected Personality value to `localStorage` whenever it changes, and restoring it on page load.

The logic is:

1. When the Personality dropdown value changes, save it: `localStorage.setItem('pmg-personality', selectedValue)`
2. On page load, read it back: `const saved = localStorage.getItem('pmg-personality')` and set the dropdown to that value if it exists.

Apply the same pattern to the Tone, Format, and Output Length dropdowns if it is not already in place.

---

## Change 3: Add a PWA Manifest So Users Can "Install" the Site

Add a Web App Manifest file ( `manifest.json` ) to the project so that browsers offer users the option to install PromptMeGood to their desktop or phone home screen like a native app.

The manifest should include:

- `name` : "PromptMeGood"
- `short_name` : "PMG"
- `start_url` : "/app"
- `display` : "standalone"
- `background_color` and `theme_color` : match the existing site brand colors
- `icons` : use the existing site logo/favicon at appropriate sizes (192x192 and 512x512)

Link the manifest in the `<head>` of `index.html` :

HTML

```
<link rel="manifest" href="/manifest.json">
```

That is all. Three changes. Do not touch anything else.
