

Fullscreen Toggle — Full Cleanup & Fix Brief

Stop iterating. Revert the toggle work cleanly and rebuild it correctly in one pass using the exact instructions below. Every file, every line.

What Is Currently Wrong (Verified Against Live Code)

1. `#aiResponseToggle` is inside `#aiResponseOutput` (app.html line 5244) — it gets wiped by `out.textContent = ''` on every "Run With AI" click (line 12620), and clipped invisible by `overflow-y: auto` on the chassis CSS rule for `.ai-response-output`.
 2. `#resultBoxToggle` anchors to the wrong parent — `.result-box-wrap { position: relative }` in app.html (specificity 0,1,0) is overridden by higher-specificity chassis CSS, so the absolute button escapes the wrap and floats over the wrong element.
 3. **Stale CSS selector** — app.html CSS uses `.ai-response-output .ai-response-toggle` as the selector, which only works when the toggle is *inside* the output div. After the fix it will be a sibling, so the selector must change.
 4. **Defensive re-insert block in `clampAiResponse()`** — the block that re-inserts the toggle into `#aiResponseOutput` if it gets detached is now actively harmful. It will fight the correct placement.
 5. `btnText` **subtraction workaround** — only needed because the toggle was inside the output and its `<` character was being counted as content. Remove it after the fix.
 6. `#aiResponseOutput { padding-right: 44px }` in `pmg-fullscreen.css` — only needed when the toggle is inside the output box. Remove it.
-

Complete Fix — Every Change, Every File

FILE 1: `artifacts/promptmegood/app.html`

Change 1A — Move `#aiResponseToggle` outside `#aiResponseOutput` (HTML, ~line 5244)

Find this exact line:

```
HTML
```

```
<div class="ai-response-output" id="aiResponseOutput" aria-live="polite" aria-a
```

Replace with:

HTML

```
<div class="ai-response-output-wrap">  
  <button type="button" class="ai-response-toggle" id="aiResponseToggle" aria-e  
  <div class="ai-response-output" id="aiResponseOutput" aria-live="polite" aria  
</div>
```

Change 1B — Fix the CSS selector for `.ai-response-toggle` (inline CSS, ~line 3432)

Find:

CSS

```
.result-box-toggle,  
.ai-response-output .ai-response-toggle {
```

Replace with:

CSS

```
.result-box-toggle,  
.ai-response-output-wrap .ai-response-toggle {
```

Also find every other instance of `.ai-response-output .ai-response-toggle` in the inline CSS block and replace with `.ai-response-output-wrap .ai-response-toggle`. There are four occurrences total (lines ~3432, ~3455, ~3460, ~3467).

Add this rule immediately after `.result-box-wrap { position: relative; } :`

CSS

```
.ai-response-output-wrap { position: relative; }
```

Change 1C — Remove the defensive re-insert block in `clampAiResponse()` (JS, ~line 8961)

Find and delete these exact lines:

Plain Text

```
// in-box-toggle-1 (2026-05-18): toggle lives INSIDE #aiResponseOutput.  
// No code in the repo wipes the output's children today, but be  
// defensive: if the button got detached for any reason, re-insert  
// it as the first child so it stays anchored at the top-right.  
if (aiResponseToggle.parentNode !== output) {  
  try { output.insertBefore(aiResponseToggle, output.firstChild); } catch (e) {}  
}
```

Change 1D — Remove the `btnText` subtraction workaround in `clampAiResponse()` (JS, ~line 8970)

Find:

Plain Text

```
var rawText = (output.textContent || '');  
var btnText = aiResponseToggle ? (aiResponseToggle.textContent || '') : '';  
var contentText = btnText ? rawText.replace(btnText, '') : rawText;  
var hasContent = contentText.trim().length > 0;
```

Replace with:

Plain Text

```
var rawText = (output.textContent || '');  
var hasContent = rawText.trim().length > 0;
```

FILE 2: `artifacts/promptmegood/public/styles/pmg-chassis-v3.css`

Change 2A — Assert `position: relative` on `.result-box-wrap` under chassis namespace

Find the comment block near line 1712 that starts:

CSS

```
/* in-box-toggle-1 (2026-05-18): .result-box-toggle is now an in-box
```

Immediately **before** that comment block, add:

CSS

```
/* toggle-anchor-fix-1 (2026-05-18): app.html's .result-box-wrap { position: re
rule (specificity 0,1,0) is overridden by chassis rules. Re-assert under cha
namespace so the absolute #resultBoxToggle anchors to the wrap, not the oute
html.pmg-chassis-v3 .pmgv3-output-host .result-box-wrap {
  position: relative;
}
```

FILE 3: artifacts/promptmegood/public/styles/pmg-fullscreen.css

Change 3A — Remove #aiResponseOutput padding-right rule (~line 180)

Find:

CSS

```
#resultBox,
#aiResponseOutput {
  padding-right: 44px;
}
@media (max-width: 480px) {
  #resultBox,
  #aiResponseOutput {
    padding-right: 40px;
  }
}
```

Replace with (keep only #resultBox , remove #aiResponseOutput):

CSS

```
#resultBox {
  padding-right: 44px;
}
@media (max-width: 480px) {
  #resultBox {
    padding-right: 40px;
  }
}
```

No Changes Needed To

- pmg-chassis-v3.js — the wrap-aware reparent logic is correct as-is

- `pmg-fullscreen.js` — `injectInlineTrigger` and `injectAiResponseTrigger` are already no-ops
-

After Making All Changes — Verify These Three Things

1. Generate a prompt. The  icon appears in the **top-right corner of the prompt box**, not above it, not in the Prompt Coach area.
2. Click "Run With AI". After the response streams in, the  icon appears in the **top-right corner of the AI response box**. Click "Run Again" — the icon is still there after the second run.
3. On mobile (or narrow viewport), both icons are visible and tappable without scrolling.

If any of these three checks fail, do not iterate — report back with which check failed and what the DOM looks like at that point.
