

Replit Agent Brief: Codebase Cleanup & Consolidation

Context for Replit Agent:

The PromptMeGood codebase has accumulated significant technical debt from multiple iterations (chassis v1, v2, and now v3). The HTML, CSS, and JS are dense with legacy code, conflicting rules, and aggressive overrides (like `display: none !important` on `body > *`) that are causing unpredictable behavior and making further development difficult.

Before we implement any new features (like the segmented tab architecture), we need to clean house.

Your Task:

Perform a comprehensive audit and cleanup of the codebase. Your goal is to make the code lean, predictable, and easy to maintain.

1. CSS Consolidation & Cleanup

- **Remove Legacy Chassis CSS:** Identify and safely remove CSS files or blocks related to `chassis-v1` and `chassis-v2` if they are no longer used. If `chassis-v3` is the definitive layout, we should not be loading or maintaining legacy styles.
- **Eliminate Aggressive Overrides:** Remove the `html.pmg-chassis-v3 body > *:not(...) { display: none !important; }` rule. This rule is a band-aid that breaks modals and overlays. Instead, properly structure the HTML so that legacy elements are either removed or cleanly hidden without affecting new components.
- **Consolidate Media Queries:** Ensure mobile breakpoints (e.g., `max-width: 768px`) are consolidated and logical. Remove redundant or conflicting media queries.
- **Clean Up Redundant Classes:** Remove CSS classes that are no longer referenced in the HTML or JS.

2. HTML Structure Audit

- **Remove Dead DOM Elements:** Search for and remove HTML elements that belong to deprecated features or legacy layouts (e.g., old "Live Feedback" panels, redundant strength score containers, old modal wrappers).
- **Ensure Clean Hierarchy:** The `<body>` should primarily contain the main app container (`#pmg-chassis-v3-root`) and any necessary global overlays/modals. It should not be cluttered with hidden legacy elements.

3. JavaScript Refactoring

- **Remove Unused Functions:** Audit the JS files (especially `pmg-chassis-v3.js` and related controllers) and remove functions that are no longer called or relate to deprecated features.
- **Simplify DOM Manipulation:** Replace complex, brittle DOM manipulation (like the current `deleteTargets` function that hard-removes elements by ID) with a cleaner, state-driven approach if possible, or simply remove those elements from the HTML entirely.
- **Consolidate Event Listeners:** Ensure event listeners are attached efficiently and that there are no duplicate listeners causing race conditions or unexpected behavior.

Goal: A lean, readable codebase where `chassis-v3` is the single source of truth, free of legacy conflicts and aggressive CSS band-aids. This will provide a stable foundation for the upcoming segmented tab architecture.
