

UX & CRO Audit Report: PromptMeGood

Auditor: Manus AI (Senior UX & CRO Auditor)

Date: May 9, 2026

Scope: Live site audit of PromptMeGood (promptmegood.com) focusing on the first-time user experience, friction, and conversion readiness.

A. Executive Snapshot

The Reality of the First-Time User Experience:

When a user visits `promptmegood.com`, they are not greeted by a traditional marketing landing page. Instead, the root domain instantly redirects to `/app`. **The app *is* the landing page.**

This is a bold, product-led growth strategy that drops the user straight into the value. The interface is incredibly polished, the dark mode aesthetic is premium, and the three-panel structure (Text, Photography, Video) feels like a true professional workstation. The Guide and Pricing pages (accessible via the topbar) are exceptionally well-written, clear, and build massive trust through honest, transparent copy.

What's breaking the experience right now:

Because the app is acting as the landing page, it carries the burden of both *explaining* the product and *operating* the product. Right now, it is failing at the operation part. The single biggest failure point is that the primary CTA — the "Generate" button — is completely missing from the viewport. A user can type a goal, but they cannot execute it. Furthermore, the topbar uses unlabeled emoji icons, forcing new users to guess how to navigate.

B. Friction Heatmap

1. The "App as Landing Page" Experience

- **Missing Value Proposition:** Because users are dropped straight into the tool, there is no headline explaining *why* they should use it. The placeholder text "Describe What You Want — We'll Build The Perfect Prompt" does heavy lifting, but it lacks the punch of a true marketing headline.
- **BETA Label:** The header says "PromptMeGood BETA". This signals an unfinished product to cold traffic, reducing trust before they even start.
- **Competing Inputs:** The "Prompt Whisperer" and the main "Your Idea" textarea compete for attention at the top of the left column. It is unclear which one the user

should interact with first.

2. Navigation and Information Scent

- **Unlabeled Header Icons:** The header uses emoji icons (👛, 📖, ⚙️) without text labels. New users have no idea what these do without hovering. They hide core features like the Vault and Expert Mode.
- **Hidden Documentation:** The only link to the excellent Guide page is a tiny " ? " icon. Most users will miss it.

3. CTAs and Flow (The Critical Path)

- **CRITICAL: Missing Generate Button:** The primary action button to build the prompt is not visible in the viewport. The only visible bottom-of-form button is "↩ Start Over", which is deeply confusing. A user can type their idea, but they cannot move forward.
- **Waitlist Mismatch:** The "Upgrade" button leads to a pricing page where checkout is not actually open (it is a waitlist). This is fine for pre-launch, but creates an expectation mismatch when clicking "Upgrade".

4. The Guide & Pricing Pages

- **Documentation Mismatch:** The Guide page tells users to tap "Analyze My Idea" and "Hit Generate My Prompt", but neither of these buttons exists in the current UI.
- **Pricing Clarity:** The Pricing page is excellent. The "Simple, Honest Pricing" headline and the clear breakdown of Free vs. Founding Member vs. Pro is top-tier copywriting.

C. Prioritized Fix List

High Impact, Low-to-Medium Effort (Do These First)

1. Restore the Generate Button

- *The Fix:* Find why the primary CTA is hidden or missing from the left column and restore it immediately.
- *Location:* App left column.
- *Why it matters:* The app is unusable without it. This directly blocks first-session activation.

2. Add Text Labels to Header Icons

- *The Fix:* Replace the standalone emojis with icon + text (e.g., "👛 Vault", "⚙️ Expert Mode", "📖 Guide") so users know what they are clicking.

- *Location:* App header.
- *Why it matters:* Increases feature discovery and reduces cognitive load.

3. Remove the BETA Label

- *The Fix:* Drop the BETA tag from the logo/header.
- *Location:* App header.
- *Why it matters:* If you are preparing for traffic and charging \$79, "BETA" hurts perceived value and trust.

High Impact, Medium-to-High Effort

1. Add a "Welcome" Modal or Overlay

- *The Fix:* Since the app is the landing page, add a dismissible welcome modal for first-time visitors that briefly explains what PromptMeGood is and how to use it in 3 steps.
- *Location:* App load (first session only).
- *Why it matters:* Provides necessary context without forcing users to find and read the Guide page.

2. Un-collapse the Tune Section on Desktop

- *The Fix:* Implement the CSS fix to keep the "Tune Your Prompt" section open by default on desktop screens.
- *Location:* App left column.
- *Why it matters:* Exposes the core value of the tool (customization) without requiring an extra click.

Nice-to-Have / Polish

1. Sync Guide Copy with UI

- *The Fix:* Update the Guide page text to match the actual buttons in the app (once the Generate button is restored) so the documentation is accurate.
- *Location:* Guide page (`/guide`).
- *Why it matters:* Reduces confusion for users reading the manual.

THE TOP 3 "NO-BRAINER" FIXES FOR THIS WEEK

If you only have time for three things this week, do these to move PromptMeGood toward feeling like a 10/10 SaaS:

1. **Restore the Generate Button:** The app is literally unusable right now because the primary CTA is missing from the viewport.
2. **Add Text Labels to Header Icons:** Stop making users guess what , , and  mean.
3. **Remove the BETA Label:** Own the quality of the product you've built.
