

PromptMeGood — Replit Task Brief: Mobile Topbar Logo Cut-off Fix

Context

The user reported that the brand logo is getting cut off on mobile devices. Based on the audit, the root cause is the global search bar (`pmg-global-search` / `pmgv3-search`) taking up a full row (`flex-basis: 100%`) at the 860px breakpoint. This forces the topbar to expand vertically, which clips the brand logo depending on container padding.

The Goal

Fix the mobile topbar layout so the logo is fully visible and the topbar remains a single clean row on mobile.

Instructions for Replit

1. Locate the CSS Rule:

- Search for `pmg-global-search` or `pmgv3-search` in `artifacts/promptmegood/public/styles/pmg-chassis-v3.css`.
- Look specifically inside the `@media (max-width: 860px)` (or similar mobile breakpoint) block.

2. Apply the Fix:

- **Do NOT** touch the logo size, brand layout, or hamburger menu styling.
- **Do** hide the global search bar entirely on mobile screens ($\leq 860\text{px}$). Users are in the builder on mobile, not searching.
- Example fix: Add `display: none !important;` to the search bar container at that breakpoint.
- *Alternative (if user prefers):* Move the search bar inside the hamburger drawer menu, but hiding it is the safest and cleanest immediate fix.

3. Cache-Bust:

- Bump the `?v=` query string on the `<link>` tag for `pmg-chassis-v3.css` in `app.html` to ensure the fix goes live immediately.

4. Verify:

- Take a screenshot of the mobile view ($\leq 768\text{px}$) and desktop view ($\geq 1024\text{px}$) to confirm the logo is intact and the search bar behaves correctly.

Constraints

- **No Backend Changes:** This is a pure CSS/UI fix.
- **No Layout Regressions:** Ensure the desktop topbar remains completely unaffected.
